Troubleshooting the 290090 TC CO2 Sensor

Troubleshooting the 290090 thermal conductivity CO2 sensor

Test

- A. Pin 3 to Pin 4 ~2vdc ----closed side is not open or shorted
- B. Pin 2 to Pin 4 ~2vdc ----open side is not open or shorted
- C. Pin 2 to Pin 4 As the percent CO2 goes up, the voltage goes down.
- D. As the condition changes from wet to dry, CO2 increases 2.5 - 3.5%.

* "Z" & "S" values are factory calibrated for 37 °C, 90%RH, and 10% CO2.

* Typical drift with time is offset only(use "CAL" menu)

* If the temperature is changed the zero and span will change. Change the "ZERO" in the "CAL" menu and the "SPAN" in either "TEST MODE"(Series II) or "CAL" menu(previous releases)
